Project ARM-1

BookMyShow

Product Team

Product Manager : Prajna Shetty

Date of Creation : 17/02/2024

Version 0.1

Introduction

BookMyShow (BMS) is the leading movie and events ticketing online platform in India. We have seen massive growth and had an immense impact on consumer behaviour. User interviews have revealed that customers face a big problem whenever it comes to booking activities collectively in a group setting. Users have expressed a desire for a more streamlined group event planning experience. This data has also been corroborated with the help of analytics data and observational studies.

Objectives

booking of tickets. This feature attempts to solve common problems associated with planning an event with a group such as attendee list curation, activity selection, and payments. The target is to improve our top-line revenue and drive ticket sales up by 20% owing to the launch of the feature. We expect that this feature will increase conversion by 50% from power users who book tickets once a month. We also expect these power users to be catalysts that encourage an increase in bookings from casual and dormant users whenever they make a group booking together.

For the first release, we will prioritize developing for iOS and Android as a majority of our target group uses mobile interfaces for ticketing and coordinating group activities with their friends and family.

Later releases may extend functionality to the web platform.

Targeted Platforms

For the first release, we will prioritize developing for iOS and Android as a majority of our target group uses mobile interfaces for ticketing and coordinating group activities with their friends and family.

Later releases may extend functionality to the web platform.

Stakeholders

Target group(s) :

- 1) Power users : High-income upper class users between the ages of 25 and 40 who make bookings via BMS more than once a month.
- 2) Casual users. : High-income upper class users between the ages of 25 and 40 who make bookings via BMS more than once every quarter

Marketing and sales: Works towards marketing the feature and showcasing unique use cases such as reunions, dates, family gatherings etc

Senior Management: Ensure compliance with overall brand identity.

Design Lead: Provides directions about UI/UX practices and game-like features of voting mechanics.

Legal: For changes in ToS, data privacy, data handling, storage/ archival/ destruction of chat logs. Ensures compliance with all necessary laws.

Use Cases

User Story #1 : Adi

Adi is a 30-year-old Corporate Lawyer who regularly goes out with his friends and family to movies and comedy events. It's Adi's birthday and he wants to take out his friends. Adi needs to know who is free on his birthday, what they want to do, where they want to go, and at what time they're available. He currently makes these plans over WhatsApp and has to manually formulate a structure of a plan and coordinate information with his friends. He dislikes failed plans, last-minute changes, drop-outs and add-ons.

Our new group booking feature will allow Adi to add people to a group and the group can then vote on what activity they want to attend, based on taste, preference and location. Thereafter, group users will have the option to make the booking and split the payments.

User Story #2 : Kritika

Kritika is a 27-year-old Doctor who occasionally goes out with her friends to movies and lifestyle events. Kritika likes to know beforehand about the certainty of plans. She feels comfortable and safe when she knows the people she's going to meet. She gets a BMS group invite from her friend Priya. She's relieved to know that her friends Arif and Arushi are also invited to this group.

The four of them vote to go and attend a pottery class on Sunday. Kritika feels confident about this plan and informs her Hospital that she will not be available for emergencies at that time. After this successful experience, Kritika continues relying on BMS groups to book advanced pottery classes with her friends.

User Story #3: Mike

Mike is a 42-year-old Software Developer. He rarely goes out to movies or events. He has recently attended his school reunion and is delighted to see a BMS group invite from his friend Suresh titled “School Reunion Movie”. He sees that more than 20 of his high school batch have marked themselves as interested in attending. After accepting the invite, he shares the invite with his friend Arun. Slowly, the group expands to over 40 attendees. The group comes to an agreement to go and watch the latest Bollywood movie. Everyone has a great time and plan to do this type of activity again.

Functionality

1. Social

The feature will require the creation of certain social features

The feature shall nudge the user to complete and update their BPS profile by adding a profile picture, name, dob, address to their BMS account

The feature shall allow users to select and add other users to their friend list

and become visible to such friends. The feature shall also allow users to create a hide list, to hide their BMS profiles from selected users in their contacts. This will prevent those contacts from sending invites to the user.

The feature can be found at the bottom nav bar in the app under “groups” tab.

The groups tab shall contain all the groups the user is participating in. i. With the ability to view, delete, hide, share groups

The feature will allow the user (admin) to create groups and send invites to other users (invitees) either directly on the app or using external sharing.

- i. The admin will have the ability to name the group – eg “Adi’s birthday
- ii. bash”
- iii. The admin will be able to customize group preferences such as
- iv.
 1. Adding more admins to the group
 2. Adding a short message
 3. Whether anyone can add more users to the group or only
- v. admin(s)
 4. Whether the date is flexible or rigid
 5. What should the window of time to vote upon the activity
- vi. (voting window) be?
 6. Whether the event is preselected or to be voted on
- vii. a. If preselected then which event is selected?
 7. Whether payments will be split or sponsored by the admin(s)

a. If sponsored, and more than one admin in group, then which admin(s) will be paying or will the admins split amongst themselves

8. The admin(s) may at any time change these settings.\

9. The admins may remove themselves from the admin role so

long as there is a minimum of one admin assigned.

- i. The invitee will have the ability to accept, deny or ignore the invite. 1. If they accept then they will be added to the group
2. If they deny then the other members will be notified of this 3. If they ignore it, then their invite will be displayed as pending
- ii. If the admin sends the invite via an external sharing, then acceptance of the invite shall amount to acceptance of friend request.

The feature shall allow the group of users to chat within the app

The feature shall allow the users to add more of their contacts to the group if enabled by the inviter.

The feature shall allow users to leave the group at any time and their exit shall be intimated within the group chat.

The feature shall display important information about the group at the top of the chat such as

- i. Admin configs .
- ii. Current attendee list
- iii. Pending attendee list
- iv. Event selected

The feature shall allow users in a group to chat with each other using text but also, pictures, gifs, emojis.

2. Voting/ Activity selection

1. The feature shall incorporate a proportional ranked choice voting (PRCV)mechanic. All users in the user group can list, in order of preference, 1 to 3 activities that they want to attend. The activity with the highest average preference score is selected.
2. While the voting window is open
 - i. The feature shall allow users to propose an activity in the chat.
 - ii. Proposed events can be put to a vote.
 - iii. The feature shall incorporate a “Smart Poll” which shall survey the
 - iv. taste, location, time preferences of the individuals in a user group. On the basis of this, BookMyShow shall offer recommendations to the group of users. Such recommendations can be put to a vote.
 - v. The feature shall allow a user who accepts the invite after the voting has concluded to propose a revote. If the revote is accepted then steps 2b and 2c shall be repeated.
3. If the voting window is closed
 - i. then admin can reopen the voting window and the voting process can
 - ii. restart

- iii. else the voting window will remain closed
- 4. The feature shall be designed to make the voting mechanic fun, exciting and game-like.

3. Booking and payment

1. The feature shall allow individual users to make bookings for the selected event. The users can select :-
2. i. Which ticket to book
ii. How many tickets to book
3. If the group payment setting is set to “split”
 - i. then the feature shall allow individual users to make the payment for
 - ii. their own tickets
 1. In this case, tickets will be added to their respective carts.
 - iii. else if the group is set to “sponsored” then the feature shall allow admin(s) to pay for the ticket.

In this case, tickets will be added to the carts of the admin(s)

c. The individual users shall find the tickets booked in their own name and sent to their respective user communication addresses.

d. The feature shall allow External Calendar integration

4. Notifications

a. The feature shall send notifications on the following events

i. Friend Request ii. Group Invite

iii. Changes to attendee list iv. Changes to event details

v. Chat messages

vi. Voting window open/ close

vii. Booking viii. Payments

ix. Ticket disbursal

Open Questions

- How can we make the selection/voting experience easy for the users? Keeping design lead in loop, can we have tinder-like swiping UI or other interactive design elements?
- How will this impact tech health metrics like latency, uptime? As there will be increase in concurrent active users?
- How will we handle race conditions?
- How will we detect spam/ bulk inviting and other such UX destructive behaviours/ ToS violations?
